

Illustrator

I'm trying to extrude a word (outlines imported as an .ai file) along a curved path, but when I try, only one letter is extruded.

Your imported .ai file is coming in to Strata as a group. Groups of object will not extrude along a path. You will need to extrude each letter individually along the path. Open the shape/group window, and place four copies of the path in it. Then extrude the each letter.

You might ask on the StrataCafe forums how others have done this to see if you get any suggestions on other ways to accomplish this.
