

Modeling

Replicate - How can I replicate an object along a curved path (like beads along a string)?

Strata does not have the ability to replicate an object along a path.

However, one of our users has written a [script](#) which you can download free from the StrataCafe to do this. Once you've downloaded and decompressed the script open it in a text editor. There are instructions on how to install and use it at the top of the script.
