Object Size - What size objects can Foto 3D model?

Theoretically, there is no limit to the size of objects that can be captured with Foto 3D CX 2. The most efficient way to capture an object is with a calibration mat.

However, if an object is too large for a mat, you can use the Marker system. While there is no size limit, you do need to be able to get photographs from all the way around the object from 10 to 20 directions.

In the User Guide, see "Chapter 7 - Using Markers" for an explanation of how to create a 3D model from photographs without using a calibration mat. The User Guide is located in the Help menu.
