

# Animation

## Stretching keyframes - What is the key combination to stretch multiple keyframes out over time?

First, you need to select all the keyframes (including the first). This can be done by click-dragging over the keyframes in a given timeline or shift-clicking each of the keyframes in the timeline.

Now, Option(Alt)-Control drag the last keyframe to expand (stretch) or compress the selected keyframes for that particular timeline.

This cannot be done across multiple timelines.
