

Strata 3D - Legacy Versions

I am attempting to render an animation in version 4.2 . When it gets to the second frame the program always crashes with the error "Could not complete your request because of a program error." The compression is quicktime- h264.

There is a problem with rendering to the H.264 codec in the Strata 3D 4.x versions of the program. This has been corrected in the latest 5.0 version. For the 4.x version of CX the solution is to render to a different codec or to numbered series of frames. Then use QuickTime Pro or another video editing program to resave the movie with the H.264 codec.

Unique solution ID: #1102
