

Advanced Editing

I can't unzip the .xmm file on Windows.

The native file format for Live 3D CX is .xmm, or Master Model. The .xmm file is actually a ZIP-style file archive, with a different extension (.xmm vs .zip.)

To access this content, unzip it to a folder on your machine, and then just open the main HTML file, typically named index.html.

If you do this, and see an essentially blank page, with a small icon where the Strata Live 3D content is supposed to be, you are probably running into a security feature of Windows. Using your file explorer, right-click the HTML file, and choose **Properties**. At the bottom, you may see a message that says:

This file came from another computer and might be blocked to help protect this computer.

Click the **Unblock** button, then **OK**. This will allow the content to run on your computer.
